The idea

72% of surveyed US registered voters want more investigations and prosecutions in the Epstein case. What does that demand look like beyond a poll?

The project looks at demand for accountability and recorded protest activity. The earlier protest records give us a reason to investigate, but do not show how people acted on the demand measured in 2026.

Who I want to reach

Journalists covering US politics, justice or protest movements. They could use the findings as a starting point for reporting on how calls for accountability become sustained public pressure.

What I want them to do

Read the article, inspect the charts and sources, and consider a follow-up story. A useful response would be a question about the data, a request to discuss the findings, or interest in further reporting.

The story I can support

Navigator found that 72% of surveyed US registered voters chose more investigations and prosecutions in February 2026. Separately, our analysis of Crowd Counting Consortium records found 491 US protest event-days with Epstein-related demands in 2025, compared with 8,953 for Gaza / Palestinian solidarity. The full comparison includes seven issues, so readers can see more than the most striking pair.

These are different periods and demands. Most Epstein protest records concern disclosure or cover-ups, not explicit prosecution. An event-day is one recorded protest on one date, not a person; categories can overlap. The figures cannot tell us what share of supporters protested, rank how much people care, or establish anyone's guilt. Sources and full methods are in the article's data companion.

What I will use, and why

Chart-led article and interactive site: the main explanation and evidence. The article gives a short route through the story; the site lets readers explore and check it.

A short journalist email: the direct route to the intended audience. It offers a clear finding, a reporting question and access to the evidence. Before sending, choose a journalist whose actual reporting fits the topic and tailor the opening to a verified article of theirs.

One chart-led LinkedIn post: a supporting route for sharing the project with professional contacts. It leads with the 72% finding and links to the article/site. It does not replace direct outreach or assume journalists will discover the post.

This is a small launch around one story, not a recurring content calendar. The email and social post are sample copy for the proposed outreach.

Proposed outreach and evaluation

Reader testing

Show the article and charts to classmates without talking them through it. Ask: What is the main finding? What does an event-day count? Can we tell whether the surveyed voters protested? What would you investigate next?

Record their answers and any confusion. If they think the figures count people or prove that poll supporters did not protest, revise the wording or labels and test again.

Choose a journalist whose reporting fits the topic. Check whether the February poll still offers a timely angle and tailor the opening to their work.

Outreach

Send the tailored email and share the supporting LinkedIn post. Both should point to the same evidence and invite readers to explore it. No paid promotion is planned.

Follow-up

Review replies and questions after a few working days. Correct any misunderstanding in the content. Make at most one relevant email follow-up if the journalist has not replied; stop unless they engage.

How I would judge whether it works

Understanding: classmates can explain the 72% finding and the limits of the protest comparison without help.

Journalist interest: record substantive replies, data requests and any reporting interest. These matter more than likes.

If the piece is understood but draws no interest, reconsider the recipient, timing or pitch.

Above the law?

Most surveyed voters want more action. What happens next?

In February 2026, 72% of surveyed US registered voters chose more investigations and prosecutions in the Epstein case. Earlier protest records offer context—but do not show how that demand translates into action.

Arvid Scarff · Berghs Growth Toolbox

In a Navigator survey conducted on 19–23 February 2026, 72% of US registered voters chose more prosecutions and investigations into people associated with Jeffrey Epstein and his criminal activities. Another 17% chose enough accountability and time to move on; 11% were unsure.[1] This measures demand for further action, not just access to documents.

Our analysis found 491 US protest event-days with Epstein-related demands in 2025, mostly about disclosure or cover-ups rather than explicit prosecution.[2] These events predate the poll. They cannot show how voters acted on the demand measured in 2026.

For wider context, consider Gaza. In September 2025, 39% of US adults surveyed by Pew Research Center said Israel was going too far in its military operation against Hamas.[3] Our analysis found 8,953 protest event-days with Gaza or Palestinian-solidarity demands across the year.[2]

The figures prompt a question, not a ranking of how much people care: how is demand for investigations and prosecutions showing up in organised protest? Answering that needs protest evidence from the same period, with demands that match the poll.

A reason to look closer

The wider comparison includes immigration, racial justice, abortion, climate and Ukraine. Epstein is not the smallest protest category: its count is above abortion and reproductive rights, and just below Ukraine solidarity. The full picture matters, not only the most striking pair.[2][4]

There are several questions worth pursuing. Do some issues have stronger groups organising protests? Does an ongoing emergency make a difference? Do people need a clear demand and someone to organise around it? What role does news coverage play?

The figures do not answer those questions. Some of the contrast may also come from comparing one case with a much broader issue, or from differences in which protests were recorded.

What the numbers mean

The Epstein poll is from February 2026; the other polls and all event counts are from 2025. The questions, populations and demands differ. We cannot say these responses caused the protests or calculate what share of supporters took part. Wanting investigations and prosecutions does not mean

everyone named in the files is guilty.

An event-day means one recorded protest on one date, not a person. Repeated protests can count on several dates, and one protest can cover several issues. Of the 491 Epstein records, 425 fall on 2 August, often within broader demonstrations.[2]

That leaves a question, rather than a verdict about how much people care: **what helps turn a demand for accountability into sustained public action?**

Data companion

Recorded US protest event-days with matching demands, 2025

Issue	Event-days
Epstein files / accountability	491
Gaza / Palestinian solidarity	8,953
Racial justice / police accountability	1,003
Abortion / reproductive rights	460
Climate action	977
Immigrant rights / anti-deportation	12,122
Ukraine solidarity	556

Chart caption: Recorded in-person protests, 1 January–31 December 2025, in the 50 US states and Washington, DC. We reviewed the demands in Crowd Counting Consortium v18.0 records and grouped them by issue; these are our counts, not official CCC movement totals. Repeat dates and protests covering several issues can contribute to the counts. Categories overlap. The figures do not count people or only protests devoted to a single issue. Of the 491 Epstein records, 425 fall on 2 August. Most concern disclosure, not explicit prosecution; all predate the February 2026 poll. Source: [2].

Sources and calculation notes

[1] Navigator / Global Strategy Group, 19–23 February 2026. Online survey of 1,000 US registered voters, recruited through an opt-in panel and verified against a voter file. Asked which side they agreed with more, 72% chose: “There should be more prosecutions and investigations into people associated with Jeffrey Epstein and his criminal activities.” The alternatives were enough accountability/time to move on (17%) and not sure (11%). Publisher-reported margin: ± 3.1 percentage points (95%); this does not cover all sources of error.

[Original poll: results p. 3, methods p. 16](#)

[2] Crowd Counting Consortium, U.S. Protest Event Data, 2025–, v18.0. Released 10 September 2026. We selected 2025 in-person records in the 50 states and DC, searched for relevant demands, and reviewed the wording to exclude ambiguous or opposing claims. Each record counts once per category. Coverage varies, differently worded demands may be missed, and scheduled repeat events may not each have been reconfirmed. This is not a complete count of all protests.

[Versioned dataset](#) · [Matched records](#) · [Coding decisions](#)

[3] Pew Research Center, 22–28 September 2025. Survey of 3,445 US adults. Asked about Israel's current military operation against Hamas, 39% answered “Going too far.” Full-sample margin of error: ± 1.9 percentage points.

[Original poll, p. 8](#) · [Report and methodology](#)

[4] Seven selected polls. Navigator (February 2026) plus six 2025 polls from Pew, AP-NORC and Gallup. The Epstein response replaces document-release support because it measures demand for more action. Dates, questions, populations and methods differ; these snapshots are not annual averages or a shared measure of concern. This is a selected comparison, not an exhaustive review. No respondents are linked to protest records.

Getting the story out

Sample journalist email

Subject: Story idea: demand for Epstein accountability beyond the poll

Hi [journalist's name],

[Personalised opening]

In a February 2026 Navigator survey, 72% of US registered voters chose more investigations and prosecutions into people associated with Jeffrey Epstein and his criminal activities.

For a Berghs coursework project, I explored that finding alongside earlier US protest records. Our analysis found 491 event-days with Epstein-related demands in 2025, mostly about disclosure or cover-ups. Of those, 425 fell on 2 August, often within broader demonstrations.

That concentration suggests a question for further reporting: what helps turn calls for accountability into sustained public pressure? Interviews with organisers, alongside protest records from the same period as the poll, could help answer it.

The existing figures do not prove a gap between voters' opinions and their actions: the protest records predate the poll and mostly concern a different demand.

The short article, charts and source notes are here: [Above the law?](#). Would this be useful for a follow-up on accountability or protest organising?

Best, Arvid Scarff

Sample LinkedIn post

72% of surveyed US registered voters chose more investigations and prosecutions in the Epstein case in February 2026.

What does that demand look like beyond a poll?

For my Berghs project, [Above the law?](#), I explored the finding alongside earlier US protest records. Those records mostly concern disclosure and predate the poll, so they cannot show whether these voters took action.

Explore the charts, sources and questions worth investigating: [Above the law?](#).

Accompanying chart

The accompanying 72% chart card shows the full response split rather than placing a percentage beside an unrelated protest count. Alt text: "Navigator survey of 1,000 US registered voters, 19–23 February 2026. More prosecutions and investigations: 72%; enough accountability / time to move on: 17%; unsure: 11%."
